```

GtkFileChooserDialog — A file chooser dialog

Synopsis

```
use GTK::V3::Gtk::GtkDialog;
use GTK::V3::Gtk::GtkFileChooserDialog;

my GTK::V3::Gtk::GtkFileChooserDialog $fchoose .= new(:build-id<save-dialog>);

# show the dialog
my Int $response = $fchoose.gtk-dialog-run;
if $response == GTK_RESPONSE_ACCEPT {
...
}

# when dialog buttons are pressed hide it again
$fchoose.hide;
```

Methods

[gtk_file_chooser_] dialog_new_two_buttons

```
method gtk_file_chooser_dialog_new_two_buttons (
    Str $title, N-GObject $parent-window, int32 $file-chooser-action,
    Str $first_button_text, int32 $first-button-response,
    Str $secnd-button-text, int32 $secnd-button-response,
    OpaquePointer $stopper
    --> N-GObject
)
```

Creates a new filechooser dialog widget. It returns a native object which must be stored in another object. Better, shorter and easier is to use .new(....). See info below.

new

```
multi submethod BUILD ( Str :$title! )
```

Create a filechooser dialog with given title. There will be only two buttons:bt1text and :bt2text. These are by defaultCancel and Accept. There response types are given by:bt1response and :bt2response. Defaults for these are GTK_RESPONSE_CANCEL and GTK_RESPONSE_ACCEPT respectively.

The filechooser action is set with:action which has GTK_FILE_CHOOSER_ACTION_OPEN as its default.

The parent window is set by :window and is by default Any.

The values are defined in GTK::V3::Gtk::GtkDialog and GtkFileChooser.

```
multi submethod BUILD ( :$widget!)
```

Create a filechooser dialog using a native object from elsewhere. See also Gtk::V3::Glib::GObject.

multi submethod BUILD (Str:\$build-id!)

Create a filechooser dialog using a native object from a builder. See also Gtk::V3::Glib::GObject.
